PROBLEM STATEMENT

Develop a Smart Public Service CRM (PS-CRM) — a centralized digital command center that organizes citizen complaints, automates workflows, assigns tasks to relevant departments, tracks progress in real time, and ensures efficient grievance resolution. To enhance transparency, accountability, and public trust, the system integrates blockchain technology for secure and tamper-proof record management.

Current Challenges in Public Grievance Management AND Why PS-CRM is Needed?

-  Fragmented Complaint Channels
-  No Tamper-Proof Records
-  Manual & Biased Workflow Routing
-  Zero Real-Time Visibility
-  No Audit Trail for Regulators
-  Poor Inter-Department Coordination

"Every day without this system, thousands of citizen complaints are lost, delayed, or buried — costing public trust and democratic accountability."

SOLUTION

Smart Public Service CRM (PS-CRM)

Smart Public Service CRM (PS-CRM): Blockchain-Enabled Transparent Grievance Management System

Smart PS-CRM is a blockchain-enabled digital grievance management platform designed to make public service complaint handling transparent, efficient, and accountable. The system provides a centralized platform where citizens, departments, and administrators collaborate to resolve issues quickly while maintaining a tamper-proof audit trail.

- **Centralized Grievance Platform** – A single digital system to submit, manage, and track citizen complaints across departments.
- **Smart Complaint Registration** – Citizens report issues with GPS location and photo evidence, generating a unique complaint ID.
- **Automated Workflow & SLA Monitoring** – Complaints are automatically assigned to departments with deadline tracking and auto-escalation if delays occur.
- **Blockchain-Based Transparency** – Every action (submission, response, escalation) is recorded in a tamper-proof blockchain audit log.
- **Community Participation** – Citizens can support existing complaints, helping prioritize issues affecting larger communities.
- **Data-Driven Governance** – Admin dashboards and analytics help authorities monitor performance and identify problem hotspots.

“Smart PS-CRM creates a transparent, automated, and citizen-centric complaint management system.”

ARCHITECTURE

TECHNOLOGY USED

Frontend (User Interface):

- React.js – Used to build the website pages that users see and use.
- Tailwind CSS – Helps design the website so it looks clean and neat.
- Axios – Sends information from the website to the server.

Backend (Server Side):

- Node.js – Runs the server and processes user requests.
- Express.js – Creates the system routes like submitting a complaint or checking status.
- JWT – Protects the system by allowing only authorized users to log in.

Database (Data Storage):

- PostgreSQL – Stores all user and complaint information.
- Redis – Helps the system work faster by saving frequently used data.

Blockchain

- Ethereum – Saves complaint records permanently so they cannot be changed.
- Solidity – Programming language used to create blockchain smart contracts.

Tools:

- Docker, GitHub, Postman – Used for building, testing, and managing the project.
